The mechanics of the aeroplane, a study of the principles of flight

Duchêne Émile Auguste
Title: The mechanics of the aeroplane, a study of the principles of flight

Author: Duchêne Émile Auguste

This is an exact replica of a book. The book reprint was manually improved by a team of professionals, as opposed to automatic/OCR processes used by some companies. However, the book may still have imperfections such as missing pages, poor pictures, errant marks, etc. that were a part of the original text. We appreciate your understanding of the imperfections which can not be improved, and hope you will enjoy reading this book.
THE MECHANICS OF THE AEROPLANE
THE MECHANICS OF THE AEROPLANE
A STUDY OF THE PRINCIPLES OF FLIGHT

BY

CAPTAIN DUCHÉNE

TRANSLATED FROM THE FRENCH BY

JOHN H. LEDEROER, B.A.
ASSOCIATE FELLOW, AERONAUTICAL SOCIETY
EDITOR "AERONAUTICS," JOINT-AUTHOR OF "THE AEROPLANE"

AND

T. O'B. HUBBARD
SECRETARY OF THE AERONAUTICAL SOCIETY
JOINT-AUTHOR OF "THE AEROPLANE"

TRANSLATORS' PREFACE

Books on aeronautics may be roughly divided into two classes: the former written from an exclusively mathematical standpoint, and hence intended for but a small circle of readers; the latter, of a more elementary and popular character, do not, as a general rule, pretend to treat the problem of the aeroplane from its more serious technical and scientific aspects.

The present work belongs to neither of these categories. Its purpose is to explain in terms as simple as possible, and with a minimum of formulae, the main principles of dynamic flight; to give the ordinary reader an insight into the various problems involved in the motion and equilibrium of the aeroplane; and to enable him to calculate in the simplest possible manner the various elements and conditions of flight.

At the outset of this work it may be well to provide against possible misconception by explaining that it in no way aspires to present in final and conclusive form the intricate problems which constitute the complete theory of the aeroplane—in view of the comparative youth of the science, such an attempt cannot be made for many years to come.

In consequence, the calculations it contains are approximate only; their numerical value, in fact, is founded on the basis of experiments so few in number that, even though their results be correct, they cannot well be accepted as final.

A few words of explanation in regard to the author's treatment of his subject may be required. In the first
place it is necessary to state—and the statement will be amply borne out by a perusal of the work—that throughout recourse has only been had to the simplest elements of mathematics and mechanics. All the mathematical knowledge required to follow the various arguments and calculations is, in fact, such as is possessed by almost every schoolboy.

The author, Captain Duchêne, is one of that brilliant band of French engineer officers whose contributions to the science of aeronautics have played a part of inestimable importance in the development of the aeroplane. Born in Paris on December 27th, 1869, he entered the Génie in 1890, after passing through the usual course at the École Polytechnique. He received his captaincy in November 1897, and was attached to the fortress of Toul, at that time one of the centres of military aerostation in France. Five years ago he was transferred to the staff at Paris.

The present work was awarded the Monthyon prize in 1911 by the Academy of Sciences. Although it may have lost in the process of translation some part of that lucidity and terseness of expression that form the most admirable and characteristic features of many French scientific works, we hope that the original value of Captain Duchêne’s book remains unimpaired in its English form; that it may serve to correct much loose thinking and misapprehension at present prevailing, and that it may succeed in its endeavour to establish a firm connection between theory and practice.

CONTENTS

INTRODUCTORY .......................................... ix

PART I

FLIGHT IN STILL AIR

CHAPTER I

Support in the Air—Action of a Wind-Current on a Plane ................................. 1

CHAPTER II

Horizontal Flight of an Aeroplane in Still Air ................................................. 9

I.—The basic formula .................................................................................................. 9

II.—The speed ........................................................................................................... 10

III.—Drift ................................................................................................................... 22

IV.—Power ................................................................................................................ 37

V.—Adaptation of the propelling plant to the aeroplane ....................................... 49

VI.—Summary of Chapter II .................................................................................... 72

CHAPTER III

Oblique Flight of the Aeroplane in Still Air ............................................................... 78

I.—General consideration of oblique flight ............................................................. 78

II.—Gliding flight ...................................................................................................... 81

III.—Starting and alighting ....................................................................................... 93

PART II

EQUILIBRIUM AND STABILITY OF THE AEROPLANE
IN STILL AIR

CHAPTER IV

Equilibrium and Stability in Straight Flight ........................................................... 100

I.—General considerations ....................................................................................... 100

II.—Longitudinal stability ......................................................................................... 109

III.—Lateral stability ................................................................................................ 141

IV.—Directional stability .......................................................................................... 154

CHAPTER V

Turning ...................................................................................................................... 156
PART III

EFFECT OF THE WIND ON THE AEROPLANE

CHAPTER VI

THE WIND—REGULAR AND IRREGULAR WINDS—THEIR ACTION ON THE AEROPLANE  
I.—The wind  
II.—Action of a regular wind on the aeroplane  
III.—The action of irregular wind on the aeroplane  

PART IV

PROPULSION

CHAPTER VII

THE SCREW-PROPELLER

TABLES—
Table of squares  
Table of square roots  
Metric and English equivalents  
Feet and metre conversion table  
Miles and kilometres conversion table  
Metres per second and miles per hour  
Velocity and pressure of the wind  
Degrees, gradients, and sines  
Symbols and notation used in the present work
